The first part of the report discusses the general situation of the project. It is noted that the work has been carried out in accordance with the programme of work approved by the Council of the Organization for Economic Co-operation and Development (OECD) in 1961. The main objective of the project is to study the effects of the various factors which influence the rate of growth of the economy.

The second part of the report deals with the methodology used in the study. It is pointed out that the data used in the study are based on the national accounts of the countries concerned. The methodology used is that of the "growth accounting" technique, which is based on the decomposition of the growth rate of the economy into the contributions of the various factors of production.

The third part of the report presents the results of the study. It is shown that the growth rate of the economy is determined by the growth rate of the capital stock, the growth rate of the labour force, and the growth rate of the efficiency of the production process. The results of the study indicate that the growth rate of the economy is primarily determined by the growth rate of the capital stock.

The fourth part of the report discusses the implications of the results of the study. It is concluded that the growth rate of the economy is primarily determined by the growth rate of the capital stock. This implies that the growth rate of the economy can be increased by increasing the growth rate of the capital stock.

The fifth part of the report discusses the policy implications of the results of the study. It is concluded that the growth rate of the economy can be increased by increasing the growth rate of the capital stock. This implies that the growth rate of the economy can be increased by increasing the growth rate of the capital stock.
